WEEK 8

DASHBOARD PROJECT REPORT

A structured report on the design, purpose and evaluation of the Week-8 dashboard

Repository	24ADI204__TEAM_10
GitHub	github.com/Deebika-M-06/24ADI204__TEAM_10
Report scope	Week-8 dashboard
Prepared	3 November 2026

Prepared as a concise academic project report

1. Executive Summary

This report documents the Week-8 dashboard component associated with the team repository. It presents the role of a dashboard in consolidating project information, communicating patterns through visual elements, and supporting quick interpretation by users. The report is organized around the dashboard's purpose, interface, analytical workflow, usability, and possible improvements.

Important scope note

The repository's Week-8 ZIP and dashboard assets could not be retrieved in this session. Therefore, this document does not claim to reproduce the dashboard's exact title, dataset, KPI values, chart labels, filters, or findings. No figures or results have been fabricated. The content below is a formal report framework describing the dashboard component at a level that remains valid without inventing project-specific evidence.

2. Introduction

A dashboard is a visual interface that brings important information together in one place. Instead of requiring a user to inspect multiple tables or files, it presents selected measures and visual summaries in a form that can be understood quickly. In a project workflow, the dashboard acts as the presentation layer between the underlying data and the person interpreting the results.

The Week-8 dashboard is treated here as the project's consolidated visualization and reporting interface. Its academic value lies in demonstrating how information can be organized, summarized, and communicated through a user-facing display.

3. Objectives

• Bring the project's key information into a single, organized interface.

• Use visual summaries to make patterns and comparisons easier to interpret.

• Reduce the effort required to locate important information in the underlying data.

• Provide a clear presentation layer for communicating project progress and results.

• Identify usability and analytical improvements for a future iteration.

4. Dashboard Structure and Components

A well-structured dashboard generally combines a clear heading, summary indicators, visual analysis, and supporting controls. The exact components in the team's Week-8 implementation must be confirmed from its source files or a live screenshot.

Component	Purpose in a dashboard
Header and navigation	Identifies the dashboard and helps users move between sections.
Summary cards / KPIs	Highlights the most important measures at a glance.
Charts and graphs	Communicates distributions, comparisons, trends, or relationships.
Filters and controls	Allows users to narrow the displayed information when supported.
Labels and legends	Clarifies units, categories, axes, and visual encodings.

5. Data-to-Dashboard Workflow

The dashboard should be understood as the final stage of a data workflow. The typical sequence is:

Step 1 — Data input: The source dataset or project records are loaded into the application.

Step 2 — Preparation: Data types, missing values, duplicate records, and inconsistent values are checked as appropriate.

Step 3 — Analysis: Relevant measures and groupings are calculated to answer the project's questions.

Step 4 — Visualization: Suitable charts and summary indicators are selected to communicate the results.

Step 5 — Presentation: The dashboard arranges the visuals and supporting information into a usable interface.

6. Interpretation of Visualizations

Each chart should be interpreted according to the question it is designed to answer. A comparison chart helps identify differences between categories; a trend chart shows how a measure changes over an ordered dimension; a distribution chart reveals spread and concentration; and a relationship chart helps examine whether two variables move together. Chart titles, axes, legends, units, and source context are essential to avoid misleading interpretation.

For the final project-specific version, each actual Week-8 chart should be inserted with a figure number, a short description of what it measures, and an evidence-based observation. Numerical claims should be taken directly from the dashboard or its source data.

7. Usability and Design Considerations

• Maintain a clear visual hierarchy so that the most important information is noticed first.

• Use consistent colors, typography, spacing, and number formats across the interface.

• Provide descriptive chart titles and readable axis labels.

• Avoid overcrowding the screen with too many unrelated visuals.

• Ensure that filters, buttons, and navigation controls have clear labels and predictable behavior.

• Use color contrast and labels so that meaning is not communicated by color alone.

8. Evaluation

A dashboard can be evaluated on four dimensions: correctness (whether displayed values match the source data), clarity (whether visuals communicate their message), usability (whether users can navigate and filter the information), and performance (whether the interface loads and responds reliably). A final review should test representative inputs, check edge cases, verify calculations, and confirm that chart labels and units are accurate.

9. Conclusion

The Week-8 dashboard represents the project's visual communication layer: it is intended to make relevant information accessible and understandable through a consolidated interface. A strong dashboard combines reliable data preparation, appropriate analysis, readable visualizations, and straightforward interaction. The exact project findings and screenshots should be added from the original Week-8 implementation before this report is treated as a fully verified record of the team's work.

10. Future Enhancements

• Add concise descriptions or tooltips explaining important metrics.

• Provide meaningful filters where they improve exploration.

• Include data refresh or last-updated information if the dashboard uses changing data.

• Improve accessibility through readable text, contrast, and non-color cues.

• Add export or download options if users need to reuse dashboard results.

Reference

Team repository: https://github.com/Deebika-M-06/24ADI204__TEAM_10

Verification note: The repository URL was supplied by the requester. The Week-8 ZIP and dashboard visuals were not accessible during preparation; project-specific labels, screenshots, metrics, and findings have therefore not been asserted.
